CHECK SYSTEM FOR NOISE, DISTANCE & OTHER OPERATING REQUIREMENTS.

* FACTORY SETTING

HOWEVER, IT IS NECESSARY TO "CHEAT" A LITTLE ON THE RS485 SPECIFICATION. THIS MODE OF OPERATION HAS BIT ORIENTATED TIMING AND IS THEREFORE INDEPENDENT OF BAUD RATE, WORD LENGTH AND PARITY, ALSO, DATA COLLISIONS AND TIME DELAYS ARE AVOIDED BY PRECISE TIMING. TO ENTER THIS MODE DO THE FOLLOWING: INSTALL A RESISTOR IN THE R12 LOCATION FOR THE MAXIMUM BAUD RATE THAT YOU EXPECT TO USE. NEXT REMOVE J9-J13 AND INSTALL J7,8,14,15. J6 IS OPTIONAL FOR 120 OHMS OF TERMINATION, EVERY "1" IN THE DATA STREAM CAUSES THE RS485 DRIVER TO TURN ON, EVERY '0' CAUSES THE RS485 TO "PULSE" FOR A TIME DETERMINED BY R12, WITH BIAS HOLDING THE "O" STATE AFTER THE PULSE. TESTING SHOULD BE DONE TO DETERMINE NOISE IMMUNITY AND OTHER SYSTEM REQUIREMENTS.

AVAILABLE FOR PRECISION CONTROL

AUTOMATIC BAUD RATE

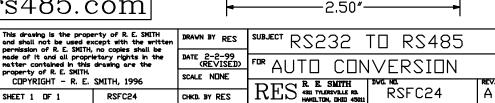

FACTORY DEFAULT SETTING IS FOR FULL AUTOMATIC MODE OF OPERATION. AT BAUD RATES ABOVE 9600 SOME RESPONSE DELAY MAY BE NECESSARY (100USEC MAX. AT 115.2K). ANY NUMBER OF DATA BITS, PARITY, AND STOP BITS CAN BE ACCOMODATED. FOR NO DELAYS IN OPERATION USE THE VALUES FOR R12 SHOWN IN TABLE AT LEFT. CALL AND ASK FOR RON IF ADDITIONAL ASSISTANCE IS NEEDED.
